Product quality

esco pond salt is a mined product that was formed around 200 million years ago in the Zechstein sea. The high sodium chloride content of 99 % and the pure white colour make esco pond salt a first-class quality product.

Product use

Dissolved in water in various concentrations, esco pond salt is used for different purposes. A specific salt concentration in water helps fish to reduce their stress levels, for instance if they have been transported a long way or have moved to a new pond. A certain salt content improves mobility and activity in sluggish fish. Moreover, it stimulates mucosal tissue formation and prevents diseases.

It also provides effective protection against parasites. esco pond salt helps to reduce the growth of algae in the water. We recommend first making up a salt solution which is then introduced slowly and in measured doses into the pond or aquarium water and distributed evenly. Otherwise concentration gradients can occur in the water. Always seek the advice of a professional, too.

Certification

The production facilities of esco – european salt company hold valid certification to EN ISO 9001.
